

HOW TO IMPROVE EMPLOYEE PRODUCTIVITY

Here are some of the ways Open iT can be used to track software usage aiming to improve employee productivity:

1

Track the number of software licenses that each employee is using.

Eliminate behavioral factors like “license hogging” or using multiple licenses simultaneously, that constrain license availability.

2

Track whether employees are using the software or not.

See how long and how frequently users are using certain applications. Assign expensive named-user licenses to users who regularly use the application.

3

Track user adoption of new applications.

Track and compare usage of applications between user-groups to enable effective user training and improve technology uptake.
